

Home Bias and Risk Sharing

Sørensen et al. 2007, Empirical Replication and Extension
PSE, Prof. Alex Clymo, Juan Pablo Ugarte

Philipp Cremer, Jannis Stagge, Felix Westerhoff

26.05.2026

Outline and Summary

Home bias and international risk sharing: Twin puzzles separated at birth

Bent E. Sørensen ^{a,b,*}, Yi-Tsung Wu ^c, Oved Yosha ^d, Yu Zhu ^c

^a *University of Houston, TX, USA*

^b *Centre for Economic Policy Research, London, UK*

^c *Department of Economics, Binghamton University, PO Box 6000, Binghamton, NY 13902-6000, USA*

^d *The Eitan Berglas School of Economics, Tel Aviv University, P.O.B. 39040, Ramat Aviv, Tel Aviv 69978, Israel*

Do home bias and risk sharing go hand in hand?

- Risk Sharing: international diversification and smoothing of income streams
- Home Bias: tendency to hold an unproportionally large share of domestic assets

1. Sørensen et al. 2007
 - 1.1 Replication of main cross section and panel regressions
 - 1.2 Extension by time and sample size
2. Eurozone Extension
 - 2.1 Investigation of eurozone home bias
 - 2.2 Channels of home bias reduction on risk sharing in eurozone

- Home bias data
 - External Wealth of Nations Database
 - Stock Market Capitalizations, World Development Indications (World Bank)
- Consumption, GDP and Income data
 - OECD National Accounts

Replication Sørensen et al. 2007

Concept of Home Bias

- same market portfolio of risky assets based on Capital Asset Pricing Model (CAPM)
- countries hold equities/bonds of each country corresponding to each country's share of world market capitalisation
- deviations from this standard are considered a "Home Bias"

Potential Explanations for Home Bias

- currency risk
- transaction costs

$$\text{Equity Home Bias}_i = 1 - \frac{w_i^{\text{foreign}}}{1 - A_i} \quad (1)$$

where:

$$w_i^{\text{foreign}} = \frac{\text{Foreign equity held by country } i}{\text{Country } i\text{'s total equity portfolio}}$$

$$A_i = \frac{\text{Stock market capitalization of country } i}{\text{Stock market capitalization of the world}}$$

and

Total equity portfolio_{*i*} = Market cap_{*i*} + Foreign equity held_{*i*} – Domestic equity held by foreigners_{*i*}

Cross-section Risk Sharing Regressions: Reminder

Setup

Risk sharing regression estimating the **degree of consumption** (Lecture 4, slide 24)

- $$\Delta \log C_{it} - \Delta \log C_t = \alpha + \beta_{C,t}(\Delta \log GDP_{it} - \Delta \log GDP_t) + \varepsilon_{it}$$

Perfect risk sharing

$\beta_{C,t} = 0 \implies$ Consumption perfectly tracks world consumption !

Exercise (Figures 1,2 of reference paper)

Plot rolling $(1 - \widehat{\beta_{C,t}}) * 100$ against foreign asset holdings over GDP

- Confirmation $\checkmark$: **Increasing trend** of risk sharing and financial openness
- Caveats $\times$: Specific **levels** of risk sharing and overall increase

► Sample

Consumption risk sharing and foreign asset holdings

Replication of Consumption Risk Sharing

Figure 1: Consumption Risk Sharing and foreign asset holdings

Consumption Risk Sharing Panel Regression

$$\Delta \log C_{it} - \Delta \log C_t = \text{constant} + \kappa (\Delta \log GDP_{it} - \Delta \log GDP_t) + \epsilon_{it} \quad (2)$$

with

$$\kappa = \kappa_0 + \kappa_1(t - \bar{t}) + \kappa_2(EHB_{it} - \overline{EHB_t}) \quad (3)$$

Focus of the analysis on:

$$RiskSharing = 1 - \kappa_0 - \kappa_1(t - \bar{t}) - \kappa_2(EHB_{it} - \overline{EHB_t}) \quad (4)$$

Original Paper

Outcome	Average risk sharing	Trend	Equity Home Bias
Consumption	57 (15.06)	2 (2.09)	−136 (5.48)

Notes: t-values are reported in parantheses.

Replication

Outcome	Average risk sharing	Trend	Equity Home Bias
Consumption	55 (15.01)	0 (0.52)	−204 (9.07)

Notes: t-values are reported in parantheses.

Within Paper Extension

Sørensen et al. 2007

Extension by Time: Risk Sharing and Equity Home Bias

Extension by time Risk Sharing and Equity Home Bias

Outcome	Average risk sharing	Trend	Equity Home Bias
Consumption	40 (19.61)	0 (0.29)	−81 (7.96)

Notes:t-values are reported in parantheses.

Extension by time and sample size Risk Sharing and Equity Home Bias

Outcome	Average risk sharing	Trend	Equity Home Bias
Consumption	30 (15.28)	0 (0.41)	−84 (8.25)

Notes:t-values are reported in parantheses.

Extensions Eurozone - European Financial Centers

The Puzzle: Euro Area Equity Home Bias

Hypothesis:

- The currency union lowers exchange rate risk and transaction cost
- After 1999, Euro Area countries' EHB should decline faster than non-EA countries
- EA aggregate decline should be less steep than Euro Area countries' EHB decline
- Lower EHB induces stronger within Euro Area Risk sharing

The Puzzle: Euro Area Equity Home Bias

Hypothesis:

- The currency union lowers exchange rate risk and transaction cost
- After 1999, Euro Area countries' EHB should decline faster than non-EA countries
- EA aggregate decline should be less steep than Euro Area countries' EHB decline
- Lower EHB induces stronger within Euro Area Risk sharing

Explanation: Beck et al. (March 2024): **The Geography of Capital Allocation in the Euro Area**

- Luxembourg, Ireland, Netherlands host massive fund industries
- Funds are owned by worldwide investors
- Standard data (e.g. EWN) looks at asset fund owner and origin - not underlying securities

Beck et al. (March 2024)

- Use regulatory data and commercial fund holdings data
- “Unwind” fund shares
- Disentangle owners and underlying securities without the funds host country
- Data Available online

Where Does Equity Investment Actually Go? - Example Germany

Note: Top 10 foreign equity destinations for DEU (2018q4). Residency-based vs. fund-unwind adjusted.
Source: Beck et al. (2024), SHS-based restated bilateral portfolios.

Note: Difference between fund-unwind adjusted and residency-based equity positions for DEU (2018q4).
Negative = position shrinks after correction; positive = position grows. '(domestic)' captures round-tripping.
Source: Beck et al. (2024), SHS-based restated bilateral portfolios.

- Left panel: Germany to foreign country position in standard data vs. corrected data
- Right panel: Net change in position of Germany to (foreign) countries after correction
- Round-Tripping

Who Actually Owns OOFB Funds?

Euro area foreign asset position in standard data strongly inflated

Corrected Home Bias: Equity vs. Bonds (Beck et al., 2024)

Figure 9: The dynamics of equity home bias in the Euro Area

Equity Home Bias

Figure 11: The dynamics of bond home bias in the Euro Area

Bond Home Bias

- corrected EA equity HB $\approx$ US trajectory - no stronger home bias reduction
- corrected EA Bond HB: clear excess decline after Euro introduction

Extensions Eurozone - Risk Sharing

Consumption Risk Sharing in the Eurozone

- Starting Point: Consumption risk sharing around the introduction of the Euro.
- Finding: Risk sharing seems to have increased around 1999 - but **can this be attributed to a reduction in the Home Bias?**

Eurozone only

Non-Eurozone

Figure 2: Consumption Risk Sharing cross-sectional estimates

What if we could isolate the different risk sharing channels? **We can!**

- **Capital Markets Channel**
- Fiscal Transfers Channel
- Credit Market Channel
- Uninsured

This methodology is based on and applied by us on the basis of:

- Asdrubali et al. (**1996**): Seminal paper (> 1000 citations)
- Hosseini and Gervais (**March 2026**): Replicable methodology (used for Eurozon sample)

Consumption Risk Sharing Channels in the Eurozone

And again, relying on rolling cross-section estimates

- Finding: After the GFC, risk sharing via credit markets markedly increased

Figure 3: Year-by-year cross-sectional estimates (10-year centred moving averages)

- Home Bias and Risk Sharing are **negatively** associated (causal relationship?)
- Finding in Sørensen et al. (2007) **robust** against various sample extensions (Note: **specification sensitivity!**)
- Erronoues Data quality leads to EHB **downward distortion**
- Debt Home Bias declined stronger in Euro Area compared to US
- Capital Markets **gradually more important** for risk sharing (after GFC)
- Consumption Smoothing remains at **low levels** compared to US
- Potential Cause: **Incomplete European Integration**, no Capital Markets/Banking Union or Fiscal Transfers

Japan	3.82	10.29	0.95	0.89
Mexico	1.16	12.48	0.99	0.87
Netherlands	40.03	68.53	0.59	0.30
New Zealand	2.80	42.60	0.97	0.57
Norway	22.23	50.99	0.78	0.49
Portugal	NA	37.38	NA	0.63
Spain	5.85	13.05	0.94	0.87
Sweden	16.05	41.60	0.84	0.58
Switzerland	40.28	47.51	0.59	0.51
Turkey	1.83	2.33	0.98	0.98
United Kingdom	23.18	36.17	0.75	0.61
United States	10.03	14.33	0.84	0.73
Average	16.46	32.91	0.83	0.66

Appendix: Volatility of cross-section estimates

The cross-section risk sharing regressions are highly volatile to the **price measurement**.

2000 as base year

Chained-linked volumes, rebased to 2020¹

Figure 4: Consumption Risk Sharing (similar for GNI)

¹ "Chained [linked volume] better reflect changes in aggregates than constant prices." (Source: OECD)

Appendix: Volatility of cross-section estimates

The sample includes Australia, Austria, Belgium, Canada, Denmark, Finland, France, Germany, Greece, Iceland, Ireland, Italy, Japan, Mexico, the Netherlands, New Zealand, Norway, Portugal, Spain, Sweden, Switzerland, Turkey, the UK, and the United States.

The sample is complete for foreign asset holdings over GDP and consumption and does not include Turkey for GNI (data availability).

[◀ Back to main](#)

Appendix: Corrected Foreign Equity Portfolio Shares

- corrected foreign share (blue) lower for aggregate than for country average
- right panel: large gap driven by reclassification from equity to underlying asset classes
- left panel: smaller gap from RoW-to-RoW-via-OOFC channel only (reclassification and intra-EA effects cancel out)
- ambiguous effects on EHB levels: lower ω pushes aggregate EHB up, larger A pushes down

Appendix: Consumption risk sharing and foreign asset holdings

Replication of Income Risk Sharing

Figure 5: Income Risk Sharing and foreign asset holdings

Appendix: Risk Sharing and Foreign Asset Holdings relative to GDP, OECD Sample 1993–2003

Original Paper

Outcome	Measure	Equity	Debt	FDI	Equity + Debt	All Assets
Income	Average risk sharing	6 (2.74)	5 (2.53)	3 (1.70)	6 (2.85)	6 (2.75)
	Trend	0 (0.77)	0 (0.34)	0 (0.47)	0 (0.37)	0 (0.47)
	Asset holdings	5 (4.50)	9 (4.46)	3 (2.70)	9 (4.65)	8 (4.35)
Consumption	Average risk sharing	51 (13.34)	45 (11.56)	51 (13.39)	47 (11.95)	48 (12.34)
	Trend	1 (0.83)	0 (0.25)	0 (0.09)	0 (0.33)	0 (0.45)
	Asset holdings	11 (4.02)	7 (1.64)	9 (3.79)	9 (2.26)	11 (2.74)

Notes: t-values are reported in parantheses.

Replication

Outcome	Measure	Equity	Debt	FDI	Equity + Debt	All Assets
Income	Average risk sharing	15.064 (4.145)	15.784 (4.211)	9.675 (2.788)	15.997 (4.253)	15.709 (4.262)
	Trend	1.202 (1.209)	0.715 (0.719)	1.685 (1.634)	0.733 (0.729)	1.069 (1.062)
	Asset holdings	12.180 (5.190)	17.747 (5.154)	11.726 (3.333)	17.583 (5.046)	20.515 (5.142)
Consumption	Average risk sharing	56.614 (14.769)	49.948 (12.157)	51.790 (12.591)	52.469 (12.928)	54.959 (13.589)
	Trend	0.942 (0.903)	0.172 (0.153)	0.455 (0.407)	0.355 (0.322)	0.497 (0.457)
	Asset holdings	17.834 (8.796)	21.312 (6.009)	14.252 (6.160)	22.576 (6.814)	24.189 (7.348)

Notes:t-values are reported in parantheses.

Appendix: Income Risk Sharing in the Eurozone

Eurozone only

Non-Eurozone

Figure 6: Income Risk Sharing cross-sectional estimates

Appendix: Consumption Risk Sharing Channels in the Eurozone

Applying this methodology, on the basis of Hosseini and Gervais (March 2026):

- Finding: 80% of output volatility unsmoothed (US interstate risk sharing), 6% via capital markets, 11% via credit markets

Figure 7: Risk Sharing Channels in the Eurozone: Panel Estimation 1995 – 2023

Appendix: Consumption Risk Sharing Channels

After the time sample between before and after the GFC:

- Finding: risk sharing improves over time through capital and credit markets.

1995 – 2007

2010 – 2023

Figure 8: Risk Sharing Channels across different time periods
